

Health Systems

Oakland County, Michigan **SKILLS NEEDS ASSESSMENT PROJECT**

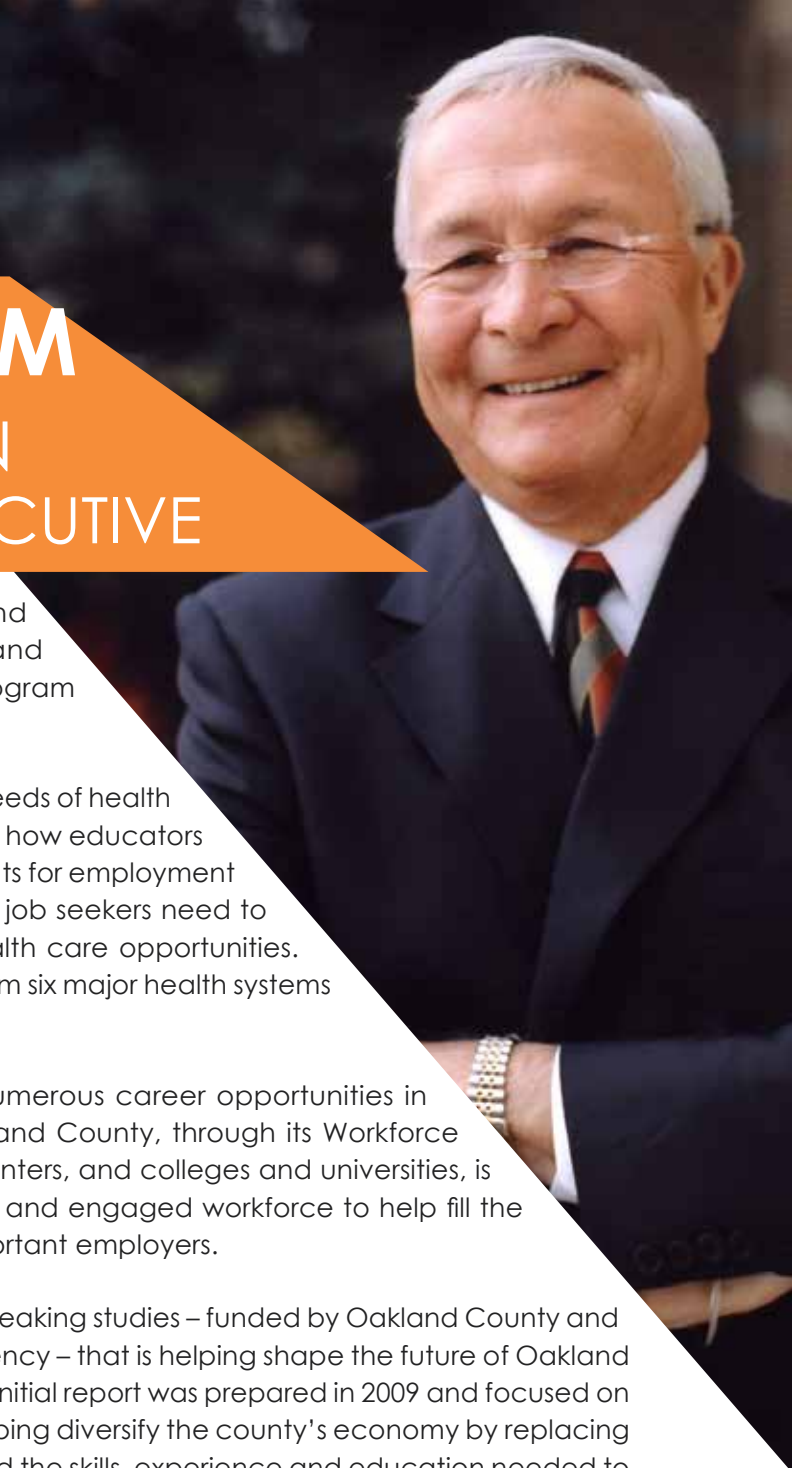

Report prepared and submitted by:

EdEn Inc.

2200 N. Squirrel Road | Rochester, MI 48309

October 22, 2014

A portrait of L. Brooks Patterson, an older man with short grey hair and glasses, wearing a dark suit, white shirt, and patterned tie. He is smiling and has his arms crossed. The background is dark and out of focus.

A MESSAGE FROM L. BROOKS PATTERSON OAKLAND COUNTY EXECUTIVE

On behalf our region's employers and educators, I invite you to review Oakland County's 2014 Skills Needs Assessment Program report.

You'll find an in-depth look at the specific needs of health systems in Oakland County and the region, how educators can best prepare their curricula and students for employment in that field and what skills and education job seekers need to qualify for one of a host of attractive health care opportunities. The information used in the report came from six major health systems from southeastern Michigan.

Health systems have told us there are numerous career opportunities in various health-related occupations. Oakland County, through its Workforce Development Division, Michigan Works! centers, and colleges and universities, is committed to helping prepare a qualified and engaged workforce to help fill the immediate and future needs of these important employers.

This report is the third in a series of ground-breaking studies – funded by Oakland County and the Michigan Workforce Development Agency – that is helping shape the future of Oakland County's knowledge-based economy. The initial report was prepared in 2009 and focused on Emerging Sectors® companies that are helping diversify the county's economy by replacing lost manufacturing jobs. The report identified the skills, experience and education needed to work for emerging technology companies. The second report, completed in 2013, focused on the needs of advanced manufacturing and provided a list of qualifications needed to be considered for one of the top 14 jobs identified in that sector.

My sincere thanks go to the Oakland County Workforce Development Board and the Oakland County Business Roundtable's Workforce and Education Committee for their support of this project as well as the Board of Commissioners for its continued support. Thanks also to Beaumont Health System, Henry Ford Health System, McLaren Health Care, Oakwood Healthcare, Saint Joseph Mercy Health System and the University of Michigan Health System for their participation in this report.

I hope you find this 2014 Skills Needs Assessment Project report useful as you learn about the many opportunities available in health care.

EXECUTIVE SUMMARY

The Skills Needs Assessment Project (SNAP) 2014 was conducted by the Oakland County Michigan Works! Agency (MWA) on behalf of Oakland County Executive L. Brooks Patterson and the Oakland County Workforce Development Board. This project is a direct result of the SNAP initiatives conducted in 2009 and 2012 targeting the County's Emerging Sectors® and Advanced Manufacturing industries, respectively. Those published reports contained "customized job profiles" for the top jobs in each of the emerging sectors and advanced manufacturing industries. Individual profiles identified the knowledge, skills and abilities (KSA's) that job seekers and students needed in order to qualify for these positions. Given the efficacy of the initial SNAP projects, the Oakland County Executive and Workforce Development Board sought to replicate and expand it for the health care industry sector.

The focal point of the project was the development of a comprehensive web-based survey tool for the collection of data specific to the needs of health care employers. Data categories on which feedback was collected included company demographics; greatest hiring challenges and suggested remedies; important but difficult to find personal competencies in job candidates; difficult to fill job openings within a particular job family; and, the knowledge, skills and abilities associated with those occupations. Customized job profiles were then created for the jobs identified as most difficult to fill.

To accomplish all of the designated goals and objectives while ensuring the accuracy of the initiative, the project was conducted in four distinct phases: Research, Design, Validation and Implementation. The Research Phase included the review and analysis of extensive employment, skills and assessment data available through various web-based information sources utilizing historic and real time labor market information. The Design Phase involved the development of an acceptable and preliminary survey instrument. As part of the Validation Phase, individuals from the educational and employer communities were engaged in the process. Educators were asked to provide feedback on job profile content and employers assisted in the final development of databank components, including job specific content (job families/jobs/knowledge/skills/abilities) and survey dissemination strategies. Lastly, the Implementation Phase involved the comprehensive roll-out of the customized web-based survey designed to obtain quantifiable data from employers.

The Skills Needs Assessment Project surveys were disseminated to employers throughout the Southeast Michigan region with the partnership and cooperation of several organizations, including the Michigan Health and Hospital Association (MHA); the Southeast Michigan Hospital HR Directors; the State of Michigan Workforce Development Agency; and the Workforce Intelligence Network (WIN). In total, surveys were pushed to approximately 1,500 health care employers of all sizes across the Southeast Michigan region (Genesee, Lapeer, Livingston, Macomb, Monroe, Oakland, Saint Clair, Washtenaw, and Wayne Counties).

Employers from various health care industry sectors were given the opportunity to complete the survey instrument and provide direct feedback on the jobs for which qualified candidates may be difficult to find. Employer representatives received an initial email invitation with a direct link to the survey instrument. Several subsequent reminders were sent to the targeted population. Ultimately, sufficient survey responses allowing for further analysis were gathered from the Health System industry sector. Respondents included representatives from Beaumont Health System, Henry Ford Health System, McLaren Health Care, Oakwood Healthcare, Saint Joseph Mercy Health System, and the University of Michigan Health System.

In total, health care employers were given the option to select occupations from four job families, including Allied Health, Information Technology, Nursing, and Professional. The job family most frequently selected by respondents was the Nursing category (43 percent).

Comprehensive survey data analysis resulted in the creation of sixteen customized job profiles representing the occupations identified as most in demand and difficult to fill with qualified candidates from the available labor pool. Job profiles are specific to the Health System industry sector only.

Job profiles were created for the following occupations:

- Cardiovascular Technologist
- Computer Systems Analyst
- Critical Care Nurse
- Diagnostic Medical Sonographer
- Medical and Clinical Lab Technician
- Medical and Clinical Lab Technologist
- Medical Records and Health Info Technician
- Nurse Practitioner
- Nursing Assistant
- Pharmacist
- Pharmacy Technician
- Physical Therapist
- Physician Assistant
- Registered Nurse with Specializations
- Speech Language Pathologist
- Surgical Technologist

In addition to information on estimated annual job openings, desired education level and regional completions, specialty knowledge areas, and important personal competencies, each job profile contains the most important KSA's.

The survey analysis also provides insight into the greatest hiring challenges regional employers encounter and suggested remedies. Most frequently identified challenges in rank order include:

- An aging workforce nearing retirement;
- Lack of job candidates with required experience;
- Financial concerns or restrictions;
- Insufficient labor pool to meet demand;
- Perception of Southeast Michigan region; and
- Insufficient clinical space for learning opportunities.

PROJECT SUMMARY BY PHASE

RESEARCH PHASE

During the Research Phase, extensive employment, skills and assessment data available through various web-based information sources were reviewed and analyzed. This initial data analysis and contextual research was used to identify health care jobs spanning multiple sectors. The EdEn team utilized Burning Glass* data extraction and analysis technologies to obtain real-time labor market intelligence. This data, coupled with other data sources, including Economic Modeling Specialist Intl (EMSI)* and direct feedback from Oakland County MWA offices, allowed for the creation of a list of in-demand health care occupations within the region. Comparative analyses against other federal labor sources were then completed, allowing for the segmentation of the occupations into job families. Feedback from health systems was also considered in order to appropriately categorize occupations into the following four job families: Allied Health, Information Technology, Nursing, and Professional. These job families were selected to minimize confusion for survey participants when selecting occupations. As much as possible, real-time labor market data was used to provide a springboard for the creation of the underlying survey databank, including occupation associated knowledge, skills, and abilities.

It was determined that employers within seven industry sectors could be targeted for completion of the survey instrument. Those industry sectors included: Clinical and Ambulatory Health Care; Health Systems; Home Health Care; Hospitals; Nursing Care Facilities; Offices of Health Generalists and Specialists; and Pharmacy and Health Retail Wholesale. A preliminary list of targeted employers was then compiled with the assistance of the Oakland County Department of Economic Development & Community Affairs, and the Oakland County Michigan Works One Stop Service Centers.

*EMSI and Burning Glass are explained in detail in page 9.

DESIGN PHASE

The Design Phase of the Skills Needs Assessment Project involved the development of an acceptable and preliminary survey instrument targeting health care employers. In brief, the EdEn team created structured and user-friendly survey instrument(s) designed to collect business information on survey takers in addition to specific input in the following broad categories: hiring challenges and remedies; important but difficult to find personal competencies in job candidates; in-demand jobs for which employers are having difficulty finding qualified candidates; associated knowledge, skills, and abilities for those jobs; specialty skills or knowledge; and the required degrees, certificates or credentials.

Critical to the Design Phase was the engagement of Dr. Ty Partridge, Wayne State University professor and statistician, and the Lindner Technology Group, Inc. (LTGI), a technology consulting, software, and services company. Dr. Partridge was instrumental in the development of appropriate qualitative and quantitative survey questions; question type and rating scale selection; data associations; and appropriate database structure to allow for valid statistical analysis. LTGI provided the information technology services required for

the development of the web-based survey instrument(s) and the secure collection of survey data. LTGI has years of experience in the development of custom database-driven websites for education partners. LTGI applications are built using industry-standard technologies, including Microsoft® Windows, IIS (Internet Information Server), .net, Active Server Pages (.asp), JavaScript, and SQL Server. Data is easily exportable to SPSS and/or Microsoft Excel for further analysis. Both of these platforms are compatible with Oakland County technology.

VALIDATION PHASE

Concurrent to the Design Phase, the EdEn Team began to solicit feedback from the educational and employer communities. Educators who were also stakeholders in the initial SNAP project were asked to provide feedback regarding the usefulness of the original SNAP job profiles. As the primary “users” of the customized job profiles, EdEn sought to determine which components contained within these profiles were the most useful to educators as well as other data components that may be useful if added to the job profiles. Several employers were also engaged in 1:1 interview sessions. The purpose of each session was to obtain specific feedback from employers on the survey databank prior to implementation. Additional research was conducted by the EdEn Team to determine the validity of suggestions, and those deemed valid and appropriate were then incorporated into the survey instrument.

IMPLEMENTATION PHASE

Upon completion of the validation process, the EdEn team was prepared to begin widespread distribution of the survey to health care employers. Several web-based communication devices clearly articulating the goals and objectives of the project were developed to appropriately disseminate the survey to the target audience through several channels. The EdEn Team also designed a webpage interface that mimicked the web brand established through the AdvantageOakland.com website which linked directly to the survey instruments. Through a collective effort involving the Michigan Health and Hospital Association (MHA); the Southeast Michigan Hospital HR Directors; the State of Michigan Workforce Development Agency; and the Workforce Intelligence Network (WIN), the survey was distributed to over 1500 health care employers in the region. During this phase, Health System human resource executives participating in the health care database work group convened by the Workforce Intelligence Network were engaged in a collaborative environment to discuss and complete the survey instrument. Ultimately, survey responses allowing for further analysis were gathered from the Health System industry sector. Respondents included representatives from Beaumont Health System, Henry Ford Health System, McLaren Health Care, Oakwood Healthcare, Saint Joseph Mercy Health System, and the University of Michigan Health System.

HEALTH SYSTEMS

SKILLS NEEDS ASSESSMENT PROJECT

SURVEY FINDINGS

The Skills Needs Assessment Project targeting the Health Care industry was another landmark study for Oakland County. In an effort to continue to advance the economic prosperity of Southeast Michigan, the County was interested in obtaining a regional perspective on employment issues. Research and analysis conducted during the project coupled historical and real time labor market data, which allowed for the accumulation of an empirical data set. This data set then served as a baseline for verification by survey participants. Adaptive technology was used to develop customized survey instruments for distribution to health care employers across the region.

The information presented in the pages that follow represents the survey findings based upon feedback from the Health Systems within the Southeast Michigan region only.

RESULTS BY JOB FAMILY

MOST FREQUENTLY SELECTED JOBS ACROSS FAMILIES

JOB	JOB FAMILY
Registered Nurse with Specializations	Nursing
Critical Care Nurse	Nursing
Cardiovascular Technologist	Allied Health
Diagnostic Medical Sonographer	Allied Health
Physical Therapist	Professional
Surgical Technologist	Allied Health
Nurse Practitioner	Nursing
Pharmacist	Professional
Pharmacy Technician	Allied Health
Physician Assistant	Professional
Speech-Language Pathologist	Professional
Computer Systems Analyst	Information Technology
Medical and Clinical Laboratory Technician	Allied Health
Medical and Clinical Laboratory Technologist	Allied Health
Medical Records and Health Information Technician	Allied Health
Nursing Assistant	Nursing

MOST FREQUENTLY SELECTED JOB FAMILIES

MOST DIFFICULT TO FIND PERSONAL COMPETENCIES ACROSS JOB FAMILIES BASED ON SURVEY RESPONSES

- 1 – Critical and Analytic Thinking
- 2 – Adaptability and Flexibility
- 3 – Dependability and Reliability
- 4 – Customer Focus
- 5 – Problem Solving and Decision Making
- 6 – Work Ethic
- 7 – Cultural Sensitivity
- 8 – Oral and Written Communication

The cumulative result of the Health Care Skills Needs Assessment project is the creation of customized job profiles. The profiles contain information specific to health systems in the region. Below is a **CUSTOMIZED JOB PROFILE GUIDE** to navigating each profile.

- Prescribe medication dosages, routes, and frequencies based on patient characteristics such as age and gender.
- Order, perform, or interpret the results of diagnostic tests, such as complete blood counts (CBCs), electrocardiograms (EKGs), and radiographs (x-rays).
- Analyze and interpret patients' histories, symptoms, physical findings, or diagnostic information to develop appropriate diagnoses.
- Develop treatment plans based on scientific rationale, standards of care, and professional practice guidelines.
- Diagnose or treat acute health care problems such as illnesses, infections, or injuries.
- Prescribe medications based on efficacy, safety, and cost as legally authorized.
- Counsel patients about drug regimens and possible side effects or interactions with other substances such as food supplements, over-the-counter (OTC) medications, or herbal remedies.
- Recommend interventions to modify behavior associated with health risks.
- Detect and respond to adverse drug reactions, with special attention to vulnerable populations such as infants, children, pregnant and lactating women, or older adults.
- Educate patients about self-management of acute or chronic illnesses, tailoring instructions to patients' individual circumstances.

BUILDING EFFECTIVE RELATIONSHIPS

REGIONAL HIRING CHALLENGES & REMEDIES

Survey respondents were asked to provide input relevant to the greatest hiring challenge faced when attempting to fill open positions. Respondents were given the opportunity to select all applicable challenges facing their respective organizations from a list of six (6) possible options. Survey findings based upon frequency of responses are shown below.

GREATEST HIRING CHALLENGES FACING EMPLOYERS

Respondents were then given the opportunity to elaborate upon the challenges selected and/or to write another challenge based upon individual experience. Comments received through the open-ended response question have been categorized and summarized below.

AN AGING WORKFORCE NEARING RETIREMENT WITH INSUFFICIENT LABOR POOL TO MEET FUTURE DEMAND

The most significant challenge facing the Health Care Systems moving forward is an aging workforce coupled with the need for an effective pipeline of health care workers to meet future demand. While the respondents expressed satisfaction with the level of preparation demonstrated by college graduates, there is concern with the trend toward a reduction in instructors which results in waiting lists for nursing school candidates. The ability to develop an effective pipeline for talent at all levels will be a significant and ongoing challenge.

LACK OF EXPERIENCE

Clinical experience was identified as the single most important quality that can be possessed by nursing and other health care employees. This is followed closely by a rapid shift toward a need for the ability to work with new technology. An overwhelming concern expressed by health system employers today is that nurses, in particular, typically fall into one of two categories. One will find either long time employees that possess a wealth of valuable experience but lack the necessary IT skills inherent in the current environment OR younger employees that have the requisite IT skills but lack important experience. More often than not, they fall into one or the other category and a vacuum, of sorts, has been created.

COMMITMENT TO THE JOB

Health System employers indicated that there has been a shift in the approach to the nursing profession by many entering the field. In the past, it was not unusual for those entering nursing programs to do so because of a long term desire or passion for a career in nursing. As the occupation of nursing was increasingly identified as one that could potentially suffer from a serious shortfall in job applicants, many entered nursing programs motivated by an awaiting job rather than any type of calling. This has the potential effect of a significant increase in turnover within the Health Systems as many that enter the nursing profession determine that it may not be the appropriate career choice. Also, job passion and commitment level may be impacted.

TRAINING OF NEW EMPLOYEES IS HINDERED BY STAFFING LIMITATIONS AND LACK OF SPACE

While educational institutions are doing a commendable job of providing qualified candidates for positions, actual employment within the Health System environment is the only way to truly assess any skill gaps and ultimate potential of a new employee. It is critically important to assess the potential technical skill sets and competencies related to actual patient care once on the job. In addition, most “on the job training” is front loaded for a nurse position in particular. This requires personnel that can devote time to both performance evaluation and further training deemed necessary. The key challenge is that, typically, health systems do not have the luxury of training departments/staff that may be found in other industries and most training is accomplished by “shadowing”, which is not ideal. Further, time spent by experienced nursing staff members for training and evaluation is in addition to, or conflicts with, their regular duties.

EMPLOYER PROPOSED REMEDIES TO HIRING CHALLENGES

Employer input regarding remedies to address employment challenges was centered on two key factors. First was the growing need for an expansion of the ability of nursing schools to produce graduates whether it is through additional faculty and staff resources or the introduction of new schools/programs. Second was the need for newly trained/educated health care workers to have some type of exposure to the work environment. This could be accomplished either in advance of completion of their individual programs of study or prior to employment after graduation.

The following are the specific remedies that were suggested by survey respondents:

- Support the development of a regional and statewide health care database for job requirements and forecasted demand.
- Education and training providers should focus more attention on the “soft skills” necessary for success in the “people centered” health care industry. Programs for Medical Assistants, for instance, are very technical in focus while not spending enough time on such areas as professionalism, customer service, critical thinking and communication skills.
- A collaborative training initiative between educators and employers that would allow students to be exposed to training in a “real world” environment. This exposure would assist in identifying individuals that may not have the organizational/people skills to handle a job. It would also help to determine if the level of interest by the potential employee truly matches the often very demanding occupations within health care.
- Health Systems may have to consider the possibility of establishing expansive internal orientation/training programs solely dedicated to better preparing new employees for entry to their new jobs. While costly, it will offset the fact that many new graduates are either not being hired due to a lack of any practical experience or, upon hiring, require undo attention of staff for training purposes. Employers will have to “bite the bullet” with funding that will provide practical training to meet growing demand.
- More nursing schools are needed.
- Longer training for certified nursing assistants and home health aide candidates would be beneficial. Ideally, it would be beneficial if the State or County subsidized the funding needed for Certified Nursing Assistant (CNA) training.
- Health systems should work closer with organizations such as K-12, post K-12 guidance counselors and Michigan Works! agencies to develop screening efforts that can do a more effective job of determining if a candidate is truly interested in the profession/job.

As a first step in the data analysis process, all variables were screened to assure that the properties of the data met the assumptions of the statistical procedures to be used. Specifically, data were screened to ensure that there were no errant values (i.e., values that were outside the possible range), that the distribution of values adequately followed the normal bell shaped curve with extreme values occurring with a low frequency and more mid-range values occurring with a high frequency, and that there were no statistical outliers, which are values that are substantially different from the bulk of the values.

Traditional statistical analyses are sensitive to deviations from these distributional properties and if such deviations are not accounted for, the analyses will produce biased results. As the majority of the data collected from this survey were categorical frequency counts, distributional properties are of less concern for the majority of the analyses reported. The data screening procedures found that both of these continuous variables had distributional properties which sufficiently approximated those assumed by traditional statistical analyses and so no further adjustments or corrections were made.

MISSING VALUE ANALYSIS

One of the most common concerns with large scale survey data collection is missing data. Missing values occur for a wide array of reasons, but they can be categorized into three broad groups based on their statistical properties. The first is missing completely at random (MCAR). This type of missing data occurs when a respondent does not record a value for some reason that does not occur systematically; for example, the respondent might accidentally skip over a question while reading. The important thing is that the reason they did not respond had nothing to do with either their potential response or any characteristic of the respondent. This type of missing data does not negatively impact statistical findings.

The second type of missing data is missing at random (MAR). While this seems an odd distinction from the MCAR category, there is a subtle, but meaningful difference. MAR data might be missing for some systematic reason, such as the order of the question on a survey with the amount of missing data increasing towards the end of the survey, but the pattern of missingness is statistically independent of the potential value of the individual's response. In other words, a respondent might have chosen not to answer a question for a specific reason, such as fatigue or running out of time, but the reason had nothing to do with the answer they would have given had they answered the question. This type of missing data has less impact on the validity of statistical conclusions and adjustments can be made to the analyses to account for this pattern of missingness.

The third type of missing data is referred to as missing not at random (MNAR). This pattern of missingness is a direct function of the potential value of the missing data. Here the respondent chose not to answer a particular question specifically due to what their answer would have been. This final pattern of missing data is highly detrimental to statistical findings and cannot be corrected statistically.

On examination, most of the missingness did appear to be related to the order of questions on the questionnaire, such that as the respondents continued with the survey process they were more likely to skip questions at the end, or end the survey prematurely. Additionally, there did appear to be a considerable amount of missing data that could be considered missing by design. In other words, there were patterns of missing data that were due to the questions not being applicable for a given respondent, given their earlier responses. This is not an uncommon finding in branching survey structures, such as was implemented in this study. While various statistical imputation techniques are available for estimating missing values, there was too much globally missing data to implement them in this dataset. In cases where the data seemed to be missing by design there is no need to impute data in any case. In only one set of reported analyses were missing data of any concern, and it was corrected for within the analyses.

CONSULTANT INFORMATION

EdEn Inc., located in Rochester, MI, is a project management firm focused on helping clients navigate the economic development landscape. Over the years, EdEn has earned a reputation for excellence as a “bridge” firm connecting southeast Michigan businesses, educational institutions, workforce development agencies, and economic development entities. As a direct result of experience working with and for regional stakeholders, EdEn has gained a unique working knowledge and perspective on collaborative initiatives. EdEn team members involved in this Oakland County Skills Needs Assessment Project included:

- David Banchiu, President
- Kristina Arnone, Vice President
- Dawn Campbell, Program Manager

In addition, EdEn collaborated with the following individuals for completion of various project components:

- Troy Lindner, President, Lindner Technology Group, Inc. (LTGI)
- Dr. Ty Partridge, Statistician, Wayne State University

AT YOUR SERVICE...

Oakland County's Workforce Development team opens the door for thousands of employers as it provides convenient one-stop access to free recruitment tools, job training programs and services.
