

HOW TO CLEAN YOUR FAUCET AERATORS

An aerator is a screen at the end of a faucet that regulates water pressure and controls the amount of water while the faucet is in use.

Over time, minerals and debris can build up in your faucet's aerator, affecting water quality and slowing the flow.

Keeping your aerators clean reduces strain on your faucets and plumbing while saving water and ensuring optimal performance.

01

Carefully twist the aerator off the tip of your faucet.

02

Separate the screen, disc and washer.

03

Soak parts in vinegar for about 30 minutes to dissolve mineral build up.

04

Rinse under water and gently brush away any remaining debris.

05

Reassemble and attach the aerator back on the faucet.
